WORLD HARD FIBER PRODUCTION CONTINUES TO RISE

World production of the 3 principal hard fibers -- sisal, henequen, and abaca -- increased again last year. The total of 1,659.2 million pounds produced in 1956 was 5.6 percent larger than the 1,571.1 million pounds produced in 1955, and 60.0 percent larger than the average of 1,036.7 million in 1946-50.

The large output was principally the result of greatly increased sisal plantings before the price break in 1951. Even since 1951 planted areas have been increasing.

Sisal output has almost doubled since the early postwar period, and now accounts for roughly two-thirds of the current hard fiber supply. Abaca production has increased by about one-half over the 1946-50 average, and accounts for about one-fifth of the current total. Henequen production has fluctuated somewhat since the war, but has decreased from the high average of 281.8 million pounds in 1946-59 to the current production of 266.9 million.

Production of <u>sisal</u> is more widespread than that of the other hard fibers. In 1956 roughly 61 percent was produced in Africa, 31 percent in the Western Hemisphere, and 8 percent in Asia.

The most important sisal-producing country is British East Africa with 506.2 million pounds or 46 percent of the total sisal in 1956. Production is continuing on a rising trend, and is now about double the prewar average. Plantations are large and well organized, and produce a good grade of fiber. Practically all of the crop is exported.

Brazil is the most important sisal producing country in the Western Hemisphere. In 1956 the output was 242.5 million pounds or 22 percent of the world supply. The industry has developed from a negligible output in 1934-38. Much of the Brazilian sisal was used within the country during early producing years, but exports were about equal to production in 1956. Stocks in the country were reduced considerably during the year.

Indonesia produces most of the sisal in Asia. Plantations suffered severe damage during the war, but have recovered gradually. Output in 1956 was 74.3 million pounds. This was 69.3 million pounds more than in 1946-50, but only 45 percent of the prewar average.

Foreign Agricultural Service. Compiled from official estimates of foreign governments, reports of U.S.D.A. Agricultural Attaches and Foreign Service Officers, and estimates based on exports or other available pertinent information.

Preliminary.

Z/ Foreign Agricultural Service estimates based on incomplete data.

Z/ Excludes flume waste beginning 1947.

L/ Includes Comores Island.

Z/ Includes Ruanda Urundi.

Z/ Not available.

Z/ Data includes only fiber inspected by the Philippine Fiber Inspection Service and Townscorts generally only 20 to 25 percent of the total Philippine production. represents generally only 90 to 95 percent of the total Philippine production. Converted at 278.88 pounds to the bale.

^{8/} Panama, Costa Rica, Guatemala, and Honduras only.

Henequen production is principally in Mexico, where the 1956 crop was 238.1 million pounds or 89 percent of the world total. Mexican production decreased slightly from 1955, but was larger than in other recent years. Exports of raw fiber were resumed in August, 1956 after a period of almost total restriction. This restriction was due to contracts between producing and distributing agencies within the country. When exports of raw fiber were resumed, exports of farm twines dropped sharply.

Abaca production is centered in the Philippine Republic where 274.9 million pounds, or 92 percent of the world supply, were produced in 1956. Philippine output was the largest since 1951, but was still about 100 million pounds less than in prewar years. Recovery of wardamaged plantations progressed for several years, but became seriously hampered by the spread of mosaic disease. After reaching a postwar peak of 278.1 million pounds in 1951, production decreased to 250.9 million in 1954. Increases were reported in 1955 and 1956.

WOOL MOVEMENT FROM SOUTHERN HEMISPHERE

Total exports of raw wool (actual weight) from the 5 major producing countries were 2.4 percent larger during July-December 1956 1/ than in the same months of 1955. Higher levels of consumption and relatively low stock levels stimulated imports into major consuming countries, despite substantially higher prices this season.

The overall gain in exports from the Southern Hemisphere resulted mainly from a substantial increase in New Zealand's exports. The latter rose from 117.8 million pounds in July-December 1955 to 159.0 million for the same period in 1956. The only other Southern Hemisphere country that contributed to the overall increase was Australia, whose exports rose from 567.1 million pounds to 579.5 million. Over this same period, exports from the 3 major exporting countries all declined, with Uruguay's foreign trade in raw wool decreasing about 34 percent. The raw wool exports from the Union of South Africa and Argentina were down approximately 6 percent, and 10 percent, respectively.

The slight gain in exports from Australia largely resulted from increased trade with Japan, Italy, the United Kingdom and Poland. Exports of raw wool from Australia to the United States were down sharply from 24 million in 1955 to 12 million in 1956.

WOOL: Exports from Southern Hemisphere countries 1956-57 season through December 1/2, with comparisons (actual weight)

1/ Season begins July 1 in Australia, New Zealand and Union of South Africa, and October 1 in Argentina and Uruguay.

Stocks of wool in Australia as of December 31, 1956 were 16 percent above the previous year, indicating that sales were not rapid enough to dispose of the 9-percent larger clip.

Production of wool in Australia is now estimated at 1,530 million pounds, greasy basis, 45 percent above the 1935-40 average. Prices of Australian wool, with minor lapses, have increased during July-December 1956 period and indications are that if they remain reasonably near current levels, production of wool will continue to increase at the rate of 3 to 5 percent yearly.

The 35-percent increase in exports of raw wool from New Zealand was due largely to increased sales to the United States and the United Kingdom. Shipment to the United States increased from 7.5 million in July-December 1955 to 18.3 million for the same period in 1956. Over this period their raw wool trade with the United Kingdom increased from 63.3 million pounds to 75.5 million. Wool prices in New Zealand have increased fairly steadily since the opening of the 1956-57 season and now are the highest since the 1950-51 Korean war boom season.

Exports from the Union of South Africa dropped from 127.3 in July-December 1955 to 119.4 for the same 6 months in 1956. This represents a drop of 6 percent. Shipments to the Soviet Union fell 84 percent, to the United States by 32 percent and to the United Kingdom by 9 percent. On the other hand, South African raw wool exports to Japan at 10.3 million pounds were nearly 3 times larger than a year earlier, and those to Italy rose 34 percent from 8.1 million pounds to 11.2 million.

The Union of South Africa's wool stocks on December 1956 were about 10 percent greater than in 1955.

Wool production for the 1956-57 season in the Union of South Africa is expected to exceed 320 million pounds, including karakul, compared with 314 million pounds for the previous season.

The average price for all wool sold in South Africa during July-December 1955 was up 31.5 percent from the corresponding period in 1955.

Raw wool exports from Argentina dropped from 50.4 million pounds in October-December 1955 to 45.2 million pounds for the same period in 1956. Reduced trade with the United States was the principal cause for the overall decline.

Production of wool in Argentina for the 1956-57 season is estimated at 419 million pounds, compared with 357 million pounds in 1955-56.

Wool prices paid in Argentina for the first quarter of the 1956-57 season were at record levels.

Exports of raw wool from Uruguay totaled 35.5 million pounds, during October-December 1956, as compared with 54.6 million pounds for the same period in 1955. Shipments to most leading markets were reduced, the heaviest declines being to the United Kingdom, the United States and the Soviet Union. The Netherlands and Japan were the only countries to take more than in the previous year.

It is estimated that Uruguayan wool production for the 1956-57 season will be in the vicinity of 70,000 metric tons, substantially less than last year.

At the beginning of the 1956-57 season, wool stocks in Uruguay were about 20 percent lower than in October 1955.

Current prices in Uruguay are about 80 percent higher than last year, and are expected to continue to remain favorable.

REVIEW OF WORLD LARD SITUATION

World production of lard and unrendered hog fat (in terms of lard) in 1956 totaled 8.9 billion pounds, approximately 4 percent larger than in 1955 and 25 percent more than the prewar average. Most of the increase occurred in the United States. Production was up moderately in most of the major lard-producing countries, including West Germany, Italy, Yugoslavia, Brazil and Mexico. The United States output in 1956 totaled 2.78 billion pounds or about 30 percent of the world total.

World exports of lard equaled approximately 745 million pounds in 1956 compared with 687 in 1955 and 360 in 1935-39. In 1956 the United States, with exports of 612 million pounds, accounted for about 83 percent of this total.

Cuba was the principal market for United States lard in 1956, followed closely by the United Kingdom. Other leading importers of lard from the United States were Yugoslavia, West Germany, Austria, Canada, Mexico, Guatemala, Bolivia and Peru. These countries took slightly over 92 percent of total United States lard exports.

Outside the United States, lard production is commercially significant in foreign trade only in Argentina, France, Denmark, Belgium-Luxembourg and the Netherlands.

Exports of lard from Argentina increased from 10 million pounds in 1955 to 22 million pounds in 1956, with Peru, the United Kingdom, Chile and Italy taking most of the shipments.

Prewar Exports from United States. 4/ Less than 500,000 pounds. 5/ 1/ Preliminary. 2/ Less than 5 years. 3/ Germany. 6/ Not available.

Foreign Agricultural Service. Prepared or estimated on the basis of official statistics of foreign governments, reports of Agricultural Attaches and other United States' representatives abroad, results of office research, and other information. France also increased its total exports of lard in 1956, due primarily to an increase in trade with West Germany. Lard exported from France to Italy was also up from 1 million pounds in 1955 to 10.5 million in 1956. French exports to West Germany, by far their most important market for French lard, increased about 15 percent due principally to the fact that the United States lard price was 50 percent higher than that of France for part of the year. This was largely due to the French policy of subsidizing lard exports.

Exports from Denmark were down about 35 percent because of increased consumption at home and also the loss of several important markets as a result of price competition.

Belgium and the Netherlands' lard exports declined, largely because of reduced trade with Eastern Europe.

REVIEW OF WORLD TALLOW AND GREASE SITUATION

The upward trend in world production of tallows and greases continued in 1956 with the rise in livestock slaughter and meat production.

World production of tallow and grease in 1956 totaled approximately 6.3 billion pounds, about 6 percent larger than in 1955, and over twice the 1935-39 average.

This gain in postwar production is largely the result of increased cattle slaughter in the United States. Rising standards of living and increased incomes in a number of foreign countries have materially strengthened the demand for tallows and greases in soap manufacturing and other industrial uses.

Production increased in 1956 in nearly all the important tallow producing countries, except the United Kingdom and France. Significant increases occurred in Argentina, Australia, Canada and the United States.

The United States, the world's leading producer accounted for about 55 percent of the world total. United States production of tallow rose sharply during World War II, tapered off somewhat in the immediate postwar years and then increased gradually to a record 3.3 billion pounds in 1956. Over this same period consumption in the United States has remained relatively stable since declining use of tallow in soap manufacturing has been more than offset by an expansion in other outlets, such as fatty acids and animal feeds. With the level of home consumption remaining practically unchanged, the United States has had to depend increasingly on exports as a means of maintaining domestic prices.

Tallow and greases: Estimated production, world and specified countries, averages 1935-39, 1945-49 and annual 1951-56

Foreign Agricultural Service. Prepared or estimated on the basis of official statistics of foreign governments, reports of Agricultural Attaches and other United States' representatives abroad, results of office research, and other information.

World exports of tallow and grease also increased materially, going from 1.7 billion pounds in 1955 to approximately 2.0 billion pounds in 1956. Most of the grain occurred in the United States where exports were up about 15 percent in 1956. The United States presently accounts for nearly 83 percent of the world trade in tallow and grease. The only other countries where exports are of any commercial significance are Australia, New Zealand and Canada. Canada has gradually increased its tallow exports from one million pounds in 1945-49 to over 50 million pounds in 1956. Over this same period New Zealand's foreign trade in tallow increased from 57 to 114 million pounds. Argentina, by far the principal exporter of tallow prior to World War II, averaging about 130 million pounds per year, shipped only 21 million pounds during the last year.

Practically all major markets for United States tallow and grease imported more in 1956, with the exception of the Netherlands where imports from the United States dropped about 10 percent. Exports from the United States to nearly all North American markets increased, with Canada, Cuba and Mexico increasing their imports substantially. United States exports of tallow and grease to South America declined in 1956 as a result of reduced trade with Colombia and Chile. The European market, however, which takes about 60 percent of United States exports, increased purchases by nearly 20 percent. Approximately290 million pounds of United States tallow and grease went to Asia, with Japan taking about 210 million and continuing to hold position as one of the most important customers for United States tallow.

REVIEW OF 1956 WORLD BARLEY AND OATS PRODUCTION

Forecasts of a record 1956-57 world production of barley and oats have been confirmed by the latest information available to the Foreign Agricultural Service. Present estimates place the 2 crops combined at 147 million short tons, a slight increase over the previous estimate in Foreign Crops and Markets of January 28, 1957. That increase results from upward revisions in estimates for both barley and oats, mainly in the Southern Hemisphere, where late harvest returns in some countries showed better yields than had been expected.

The estimate of 147 million tons is only slightly above the total for the previous year but is sharply above the low level of 115 million tons in 1945-49 and also well above the prewar average of 127 million. Since the prewar period, a marked increase in world barley acreage and production has more than offset a decline in oats.

BARLEY: Acreage, yield per acre, and production in specified countries, year of harvest, averages 1935-39 and 1945-49, annual 1954-56 \mathcal{N}

Wears shown refer to years of harvest in the Northern Hemisphere. Harvests of Northern Hemisphere countries are combined with those of the Southern Hemisphere which in 1956 are ended early follow; thus, the crop harvests which begen late in 1956 and ended early in 1957. So combined with prelationary forecasts for the Southern Hemisphere harvested areas as far as possible. If each of possible and production data shown, except for incomplete periods. As revised estimates for Northern Hemisphere countries; for Southern Hemisphere, revised prelating countries of history. So countries shown and for other producing countries not shown. S. Weverge of less than 5 years. If Figures for 1955 only. E. Schimates for shown separately during this period shown ere not shown separately during this period. LOF Figures for the period shown ere not strictly comparable throughout, since figures for 1954-56 include allowances for non-reporting areas, which were not included for earlier periods shown, but were included in estimated total for Asia.

Foreign Agricultural Service. Prepared or estimated on the basis of official statistics of foreign countries, reports of United States Agricultural Attaches abroad, results of office research, or other information. Prewar estimates for countries having changed boundaries have been adjusted to conform to present boundaries.

OATS: Acreage, yield per acre, and production in specified countries, year of harvest, averages 1935-39 and 1945-49, annual 1954-56 \underline{J}'

1/ Years shown refer to years of harvest in the Northern Hemisphere. Harvests of Northern Hemisphere which immediately follow; thus, the crop harvested in the Northern Hemisphere in 1956 and ended early in 1957. 2/ Figures refer to harvested areas as far as possible. 3/ Yield per acre calculated from acreage and production data shown, except for incomplete periods. 4/ Revised estimates for Northern Hemisphere countries; for Southern Hemisphere, revised preliminary forecasts. 5/ Froduction and yield reported in busiels of 34 pounds. 6/ Estimated totals, which in the case of production are rounded to millions, include allowances for any missing data for countries shown and for other producing countries not shown. 7/ Average of less than 5 years. 8/ Figure for 1955 only. 3/ Comprises Albanta, Bulgaria, Czechoslovakia, Eastern Germany, Hungary, Poland and Rumania. 10/ Includes estimate for Lebanon, and is, therefore, not strictly comparable with estimates shown for later years. Foreign Agricultural Service. Prepared or estimated on the basis of official statistics of foreign governments, reports of United States Agricultural Attachee abroad, results of office research, or other information. Frewer estimates for countries having changed boundaries have been adjusted to conform to present boundaries.

World barley production is now estimated at the record figure of 3,295 million bushels, 30 million more than the previous estimate. The bulk of the increase occurred in Argentina where an unprecedented harvest is now reported. The current world estimate is 200 million bushels above the previous record of 1955. Much of that increase is in West Europe, traditionally North America's largest outlet for barley. While increases were general throughout the area, a sharp increase in France's outturn accounted for the bulk of the gain, and enables that country to compete for markets in other countries of West Europe.

World production of oats is estimated at 4,250 million bushels. Though 25 million bushels above the previous estimate, this is 195 million bushels less than the 1955 harvest. The reduction results from a sharp cut in the United States crop, which is only partially offset by larger crops in Canada, Western Europe, and South America. Though the world total is also moderately below the prewar average of 4,364 million bushels, that decline is much less than the acreage decline. Continuing cuts in acreage of oats have brought world acreage from the prewar level of 144 million acres to a low of 124 million in 1956.

North America's barley production is estimated at 659 million bushels, little change from the 1955 total, which was double the 1935-39 average. The acreage increase during the same period was considerable but not proportionate to the production gain. The total of about 22 million acres in 1956 was 43 percent above the 1935-39 average of 15.5 million. A moderate decline from last year's crop in the United States was offset by an increase in Canada. The outturn of 278 million bushels in Canada compares with 252 million a year ago and the prewar average of 89 million. Yields in both Canada and the United States show marked increases over prewar.

Production of oats in North America was greatly reduced from the 1955 total but is still somewhat above prewar. The reduction from the high 1955 figure results from the sharp cut in the United States outturn. Both acreage and yields were below the high levels of 1955 and the resulting reduction in the United States crop was only partially offset by a substantial increase in Canada. This country's harvest of 534 million bushels has been exceeded only twice. The large crop is attributed to near record yields on an acreage 10 percent below the 1935-39 average.

Production of these grains in <u>West Europe</u> was large mainly because of the record outturn of barley. The harvest of 853 million bushels is 158 million bushels above the 1955 crop as a result of substantially increased acreage and above-average yields. Of the 2.8 million acre increase over the 1955 total, more than 85 percent was reported for France, where a large part of the winter killed wheat acreage was re-seeded to spring barley. Yields in that country were at a new high and the 1956 outturn of 275 million bushels contrasts with the prewar average of 53 million. Oats production in <u>West</u> Europe is estimated at 1,093 million bushels. This is slightly above the 1955 total but is not up to the prewar average of 1,135 million.

The 1956 outturn of these grains in Eastern Europe is estimated to be moderately below the 1955 production and somewhat less than average. The barley total, estimated at 197 million bushels, compares with 210 million a year earlier and the prewar average of 253 million. Smaller yields than in 1955 were general throughout the area. Total production of oats is estimated at 319 million bushels compared with 347 million in 1955 and the prewar average of 473 million.

In the Soviet Union larger acreages of barley and oats appear to have resulted in some production increase over the 1955 total for the two grains. This year's total, however, is still somewhat below the prewar average.

The increased acreage resulted mainly from re-seeding of breadgrain acreage, which had suffered extensive winter killing in the south and central regions of the Union. It appears that less favorable weather conditions, especially during the harvest period, resulted in some lowering of the barn yields of these grains.

Asia's production of both barley and oats was less than in 1955 mainly because of smaller outturns in Turkey. Yields in that country were somewhat below average because of drought. Turkey's barley production, as estimated at 100 million bushels, is the smallest harvest since 1950.

Moderate reductions are reported for most important producing countries of the area, exceptions being Iraq and Syria where near-record crops provide surpluses for export. Syria's 1956 harvest of 29 million bushels contrasts with the very small outturn of 7 million bushels last year. Production of oats in Asia is estimated at 102 million bushels compared with 108 million last year.

Barley production in Africa was large mainly because of exceptional yields in Algeria and French Morocco. Those two countries produced about three quarters of Africa's total of 161 million bushels in 1956. Oats production for Africa was 20 million bushels, the same as in 1955.

Large crops in South America, mainly in Argentina, bring the total for barley to more than double the prewar average. The current estimate of 84 million bushels for that continent is 20 percent above the 1955 total. Oats production of 91 million bushels is about 50 percent above last year's outturn.

Australia reports a record crop of barley and a near-record harvest of oats. The barley crop of 47 million bushels contrasts with the prewar average of 12 million bushels. Both acreage and yields were sharply above average. Production of oats, as reported at 55 million bushels is somewhat below the record crop of 68 million last year but is, with that exception, the largest crop on record.

REVIEW OF THE 1956-57 WORLD CORN CROP

World corn production in 1956-57 is estimated at the all-time record figure of 6,615 million bushels. This is about 30 million bushels larger than the earlier forecast of the current crop and exceeds the previous record production in 1955 by 330 million bushels.

Increases over the 1955 outturns in the United States and the Soviet Union account for the bulk of the pain over the previous year's total. Those significant increases, with moderate increases for Asia and Africa, more than offset reductions in Europe and South America. The current estimate for world production is 1,325 million bushels above the 1945-49 average, reflecting higher yields in the United States resulting from greater use of higher yielding hybrids, and sharply increased acreage in the Soviet Union.

Though the United States crop was 154 million bushels less than the record 1948 harvest, record carry-over stocks on October 1 bring corn supplies for the current season to an all-time high. Prospects are poor for the harvest now under way in Argentina, because of severe drought, and it appears that there will be little, if any, corn available for export from that historically important corn exporting country.

Corn production in North America is estimated at 3,686 million bushels, second only to the 1948 record of 3,785 million. The United States production, which accounts for more than half the world corn crop, was the second largest of record, and 220 million bushels above the 1955 harvest.

While the United States outturn of corn for all purposes was larger in 1948, the 1956 crop set a new yield record at 45.4 bushels per acre. The high yields largely offset the lower acreage which was 9 million less than the 1948 harvested area. The 1956 acreage of 76 million was the lowest since 1890. Mexico, the second largest producer of the area, reported a near-record crop of 150 million bushels.

Europe's corn outturn is estimated at 675 million bushels, 50 million below the large harvest of 1955. The bulk of the reduction was in the Danube Basin countries where conditions were relatively unfavorable in 1956 and harvests appear to have been somewhat below average.

In Italy and France, in contrast, yields were unprecedentedly high. In France, acreage was also at a new high, and the production of 70 million bushels contrasts with the low 1945-49 average of 10 million. The crop of 134 million bushels in Italy was also at a record level, the high yields offsetting some reduction from prewar acreage.

A program stressing corn production in the Soviet Union has effected a great increase in corn acreage in that area. Sharp increases in each of the past 2 seasons have resulted in an almost five fold increase over the 1954 acreage. Since a large proportion of the expansion was made in a number of the more northern and eastern regions where the growing season is too short for maturing corn for grain, a large proportion of the 1955 and 1956 corn crops was harvested for green fodder. Early frosts in many areas aggravated that situation this year.

Asia's estimated production of 730 million bushels was slightly above the 1955 crop and well above average. The increases are mainly due to expanded acreage. Slight increases are indicated for most of the principal producing areas. The principal exception is Turkey, whose harvest was slightly smaller than that of recent years because of drought damage.

Corn production in Africa is now estimated at 360 million bushels, 20 million more than the previous forecast. Most of the increase from the earlier forecast is in the Union of South Africa the principal producer of the continent. Production there is tentatively placed at the record figure of 142 million bushels, which would be 40 percent of Africa's total. If the harvest now in progress in that Southern Hemisphere country is as large as now forecast, it will add to the already sizable surplus of corn for export there. A near record crop is reported for Egypt, the second largest producer of the area.

The corn harvest now under way in South America is tentatively placed at 460 million bushels, considerably below average, on the basis of preliminary reports. Drought conditions have reduced the crops considerably below earlier expectations in a number of countries. The reduction was especially marked in Argentina and Uruguay.

(Text continued on Page 26; table follows)

crop harvested in the Northern Hemisphere in 1956 is combined with preliminary forecasts for the Southern Hemisphere harvest which begins early in 1957. Z/ Figures refer to harvested are as possible. Z/ Nield per sore calculated from acreage and production data shown, except for incomplete periods. L/ Revised estimates for Northern Hemisphere countries; for the Southern Hemisphere feathern femisphere, revised preliminary forecasts. Z/ Nverage of less than 5 years. E/ Estimated totals, which in the case of production are rounded to millions, include allowances for any missing data for comparable, since figures for 1954-56 include estimates for norreporting areas, which were not included with earlier figures shown, but allowances were included in estimated total for Africa.

Allowances for native cultivation, not shown, are included to africa. J/ Years shown refer to years of harvest in the Northern Hemisphere. Harvests of Northern Hemisphere, countries are combined with those of the Southern Hemisphere which follow; thus the

Foreign Agricultural Service. Prepared or estimated on the basis of official statistics of foreign governments, reports of United States Agricultural Attaches abroad, results of office research, or other information. Prewar estimates for countries having changed boundaries have been adjusted to conform to present boundaries. In Argentina the present forecast of 115 million bushels is only moderately above domestic use in a number of years. The low level of the expected crop has raised the possibility of a ban on further exports. Argentina was, until recent years, the world's leading corn exporter. The forecast of 115 million bushels compares with 152 million a year ago and the prewar average of 302 million.

In Australia corn is of minor importance. A crop of 4.5 million bushels is forecast for the present harvest, compared with the prewar average of 7 million bushels. The reduction is due to about a onethird drop in acreage.

WORLD CATTLE NUMBERS 1956 AND ESTIMATES FOR 1957

World cattle numbers continued to increase to a new record at the beginning of 1957. The total is estimated at 937 million head. This is about 1 percent more than a year earlier, 20 percent above 1946-50, and 24 percent above prewar.

From 1956 to 1957 numbers continued to rise in all major areas except North America. Compared with prewar, numbers are particularly large in North and South America, Africa and Oceania. (Water buffalo are included with cattle in the countries where they are important).

In recent years conditions have been especially favorable for cattle production in large areas of the world. Specialized cattle production has increased in many tropical and semi-tropical countries. There have also been strong demand and higher prices for beef. New strains of cattle have been developed which are better adapted to the adverse climatic conditions of many of those areas. Increased productivity per animal has been the result of better husbandry and management, better pastures, greater availability of feed, more effective control of insects, pests and diseases. Many governments are encouraging cattle production by diversifying farming operations, thereby increasing the productivity of farms.

Cattle production in South America is expanding, but much of the increase in recent years has occurred in new areas in such countries as Brazil, Bolivia, and Colombia, rather than in established areas such as Paraguay and Uruguay. Apparently low beef prices are discouraging production in Paraguay and Uruguay and competition from wheat and sheep has held down production in Uruguay. Production in Peru has been affected by drought. Numbers in Argentina, however, reached a new high in mid-1956 according to a recent census.

FOREIGN CROPS AND MARKETS World Summaries

There has been considerable development of the meat packing industry of Africa in recent years. This may further encourage cattle production. Slaughter plants are being built in Ethiopia, Eritrea, Angola, the Rhodesias, Bechuanaland, and South West Africa. Previously, demand for beef and cattle in these countries has been limited largely to domestic use and exports of hides. Increased living standards and agricultural development have contributed to a sharp increase in cattle numbers in central and Northern Africa in recent years. Apparently numbers in the Union of South Africa have not changed much. However, decontrol of beef prices in early 1956 has tended to encourage production.

In Asia, cattle numbers have increased along with farm productivity and population. In much of this area cattle are used as work stock and to provide milk. The raising of cattle for meat is of minor importance. Numbers in India and Pakistan continue to increase at a relatively constant rate. In recent years numbers in Red China also have risen, according to Communist sources. Numbers are considerably above prewar in Turkey, Iran, and Japan.

Cattle numbers in North America decreased during 1956 due to a decline of 1.6 million head in the United States. In this country cattle numbers had been increasing every year since 1949 to establish an all-time high of 96.8 million head at the first of 1956. The 20 million gain in numbers on farms has been accompanied by a sharp increase in slaughter and beef production.

It is expected that numbers in the United States will continue to decline for a few years and the decrease may be slower than in past cycles. Since 1890 the general trend in numbers has been upward, but the uptrend has been interrupted by 5 periods of decline ranging from 4 to 10 years in length. The numbers' cycle has received wide attention and study in the United States but not in other countries, except Canada.

Numbers in Canada continued to rise in 1956 to reach 9.8 million head in December. However, this total was still below the record high of 10.3 reached in December 1944. Numbers in Mexico and Cuba continue to rise.

Numbers increased moderately in Europe during 1956. Further cattle expansion in the area is likely to be relatively small because of other agricultural enterprises are competing for the land. Numbers in the largest producing countries -- West Germany, the United Kingdom and France rose moderately from 1956 to 1957. Numbers also increased in Belgium, Denmark, Ireland, but declined in Austria and Yugoslavia.

Cattle numbers have increased substantially in the U.S.S.R. during the past few years, according to Communist sources. The latest estimates of numbers reported are for October 1956.

1/End of year estimates (October to December) included under following year for comparisons and totals. Thus for Canada the December 1971 estimate of 7,936,000 is shown under 1952. 2/Preliminary. 3/Average for 2 to 4 years only. 4/duly. 5/March. 6/Hay. 7/dune. 8/Gensus or estimate for single year. 9/Official statistics; may be under estimates of actual numbers. 10/September. 11/Includes buffaloes. 12/Gensus December 31, 1934. 13/One year and older. 11/October. 15/1952 data National estimate of China mainland. Excludes outer Mongolia. 16/Includes estimates for Outer Mongolia. 17/Number

Compiled from official sources, reports of agricultural attaches and other U.S. representatives abroad. Data for countries having changed boundaries relate to present territory. Totals include estimates for countries for which official statistics are unavailable. Foreign Agricultural Service. April 1957.

Cattle numbers in Australia have reached a new record high. Range conditions have been unusually good and producers' prices have been satisfactory. But numbers in New Zealand declined moderately last year due to relatively low returns from dairying.

The countries having the largest numbers of cattle are India, the United States, Brazil, Russia, Argentina, the Mainland of China, Pakistan, Ethiopia and France. Australia and Mexico rate close to France with about 17 million head each.

WORLD SHEEP NUMBERS 1956 AND ESTIMATES FOR 1957

World sheep numbers continued to increase slightly during 1956. The total, estimated at 919 million head, is 2 percent greater than a year earlier, 29 percent above the 1946-50 average and 23 percent above prewar.

The upward trend in the postwar period was due to relatively favorable wool prices and returns from sheep. Grazing conditions in the important sheep producing countries have favored increased production. High production costs, however, resulted in smaller numbers in the United States and Canada.

Australia's sheep numbers increased sharply during 1956. According to Soviet published information, numbers in the U.S.S.R. continued to increase. Only minor changes occurred in Asian, African, or South American numbers. North American numbers declined slightly during the year.

Compared with prewar, numbers are unusually large in Asia, Africa, and Oceania. They are near prewar levels in Europe, but about 35 percent below prewar in North America.

An outstanding development in the world sheep situation in recent years has been the sharp increase in Australia where numbers are now estimated at about 151 million head, an increase of 33 million since 1952. There are now 48 million more sheep than the average for 1946-50 and 38 million more than in 1936-40. Australia has more sheep than any other country in the world, and nearly 5 times as many as the United States.

Wholesale eradication of rabbits by myxomatosis disease has greatly increased the pasture-carrying capacity for sheep in Australia. Also there has been some development of irrigation and improvement in pastures. Wool prices have been favorable to producers. Australia has had better-than-average grazing conditions for a number of years.

Grazing conditions were unusually good in 1956 and prospects are bright for another good year. In the past 2 years, grazers have bought old sheep for re-stocking which under more normal conditions would have been slaughtered. It is difficult to determine the extent to which the overall grazing capacity has increased, but an unfavorable grazing season would probably result in an increase in sheep slaughter and might reduce numbers on farms and ranches. Cattle numbers are also at record levels.

Numbers in New Zealand increased from 35.4 million in April 1952 to 40.3 million in April 1956. High wool and lamb prices and relatively low returns from dairying are encouraging expansion.

Sheep numbers in the Soviet Union are reported to have increased from 115 million head in October 1953 to 130 million in October 1956. The October estimates are not comparable with those previously published for January 1. The October data include most of the current years' lamb crop and October-December is a period of large slaughter. The U.S.S.R. has been a sizable importer of wool in recent years. It is striving to increase sheep numbers, especially of fine wooled sheep.

Sheep numbers have changed little in South America in the past 3 years. Numbers in Argentina and Uruguay probably will increase unless grazing conditions become unfavorable. Wool prices in Argentina increased sharply during late 1955, as a result of the devaluation of the peso, and wool prices increased relative to prices of cattle.

Wool production in Uruguay this year is reported to be lower due to a poor grazing season and low yield per sheep. The government has also cancelled a decree which was in effect last year, requiring the consumption of 1 pound of mutton for each 5 pounds of beef, which encouraged sheep slaughter. The May 1956 census reported 23 million head of sheep in Uruguay which was below previous expectations. The previous census of May 1951 reported 23.4 million. Relatively good returns from wheat have limited sheep raising.

Sheep production in Peru has been severely curtailed by drought. Apparently numbers are continuing to increase in Brazil, where a price support program for wool has been a factor encouraging expansion.

Numbers may have increased slightly in Asia during 1956. In recent years there has been considerable expansion in sheep production in Iran and Iraq. But numbers in Turkey, India, and Pakistan probably have not changed much. There has been a sharp increase in sheep raising in Japan, although that country is not a large producer.

1/End of year estimates (October to December) included under following year for comparisons and totals; thus, for Canada the December 1, 1951 estimate of 1,016,000 head is shown under 1952. 2/Preliminary. 3/May. 4/Genaus or estimate for single year. 5/June. 6/Average for 2 to 4 years only. 7/Official estimates; may be under estimates of actual numbers. 8/September. 9/March. 10/Spring. 11/Genaus, December 31, 1940. 12/One year old and older. 13/October. 11/Mumber taxed only. 15/Includes China proper (22 provinces) Manchuria, Jehol and Sinklang (Turkestan), excludes Outer Mongolia. 16/Includes animals under one year old. 11/Estimates for former area of Spanish Morocco are for June 1. 18/Includes goats. Compiled from official sources, reports of Agricultural Attaches and other United States representatives abroad. Data for countries having changed boundaries relate to present territory. Totals include estimates for countries for which no official estimates are available. Foreign Agricultural Service, April 1957.

Official announcement of the second 5-year plan for Communist China for the years 1957-62 reported the number of the country's sheep and goats in 1952 at 61.8 million head. This was slightly less than the peak reached in 1937. The Communists would like to bring about a sharp increase in numbers. It is likely that sheep numbers now are somewhat greater than in 1952.

There was a moderate increase in sheep numbers in Africa during 1956. Numbers continued to increase in Algeria and French West Africa but apparently there was little change in other areas, including the Union of South Africa. There were 37 million sheep in the Union in August 1954, according to a census taken then.

Sheep numbers in Algeria increased during 1956 and apparently the increase is continuing in 1957. Exports of sheep and mutton were large in 1956. Pasturage was particularly good. Strong demand for meat by the military encouraged sheep slaughter. The principal livestock markets were amply supplied with well finished animals. Some sheep were killed or stolen by terrorists but such losses were small in relation to total numbers.

There was little change in sheep numbers in Europe during 1956. Slight increases were reported in France, Greece, and the United Kingdom.

For Spain, the Director-General of Livestock stated there were 22 million sheep in the fall of 1956. A compulsory vaccination program against blue-tongue disease began in the affected provinces of southern Spain in mid-September. By the second week in November, it was reported that 8 million sheep had been vaccinated. It was reported that 50,000 sheep died from the disease last year. The outbreak had spread to 10 provinces but the current vaccination program has been effective in preventing further spread of the disease.

Portugal recently initiated a vaccination program against bluetongue in that country. According to reports, 4 million doses of vaccine have been made available to flock owners this spring. Blue-tongue spread widely in Portugal in 1956.

Sheep numbers in both the United States and Canada declined slightly last year. The 30.8 million head on farms in the United States in January 1957, except for 1950 and 1951, the lowest since annual estimates became available beginning in 1867.

WORLD CUTPUT OF DAIRY PRODUCTS, FOURTH QUARTER AND ANNUAL, 1956

Fourth Quarter:

Over-all factory production of dairy products increased in the fourth quarter of 1956, compared with the same quarter of 1955. In most countries of West Europe, except Sweden and Switzerland, conditions were favorable for milk production. Less satisfactory conditions prevailed throughout much of the quarter in Australia and New Zealand, and milk production for the quarter declined slightly. Milk production also dropped in Canada, but was up in the United States.

Butter production (in factories) in the fourth quarter, 1956 was up approximately 8 percent over comparable 1955. Output was down in the major producing countries, including Australia, New Zealand, the Netherlands, Sweden, Canada, and the United States. Little change in production occurred in the Federal Republic of Germany, All other countries reported increased output in this period.

Factory cheese production showed the biggest gain in the fourth quarter, 1956, rising 16 percent over the corresponding quarter of 1955. Substantial increases were reported in Australia, Denmark, Norway, France, the United Kingdom, Canada and the United States, but smaller output was reported in the Netherlands, Sweden, Switzerland, Argentina and New Zealand.

Canned milk production in the October-December quarter rose 5 percent over comparable 1955, all countries reporting expanded production except Argentina.

Output of dried milk was up 2 percent. Sweden, the United Kingdom and Argentina increased their production in the fourth quarter. Declines were reported by the Netherlands, Canada and the United States, while Australia maintained output at the 1955 level.

Prospects for production in Australia appear to be satisfactory for dairy production. General rains are necessary in most areas of New Zealand if a serious drop in production is to be avoided.

Annual: The year 1956 as a whole was a good one for dairy production in almost all of the major producing countries. Favorable weather conditions, some increase in dairy cow numbers and in yield per cow in some countries, were reflected in higher milk production than in the preceding year. With more milk from the increased production becoming available for manufacturing, the over-all output of dairy products for the year was substantially above a year ago.

FACTORY DAIRY PRODUCTS: Output in principal producing and exporting countries, 4th quarter (calendar) 1956, (preliminary), with comparisons

Agricultural Service. Prepared or estimated from official statistics, reports of Agricultural Attackes and other U.S. representatives abroad and other information. April 22, 1957.

MEDITERRANEAN BASIN OLIVE OIL PRODUCTION UP - QUALITY HIGH

Mediterranean Basin olive oil production in the 1956-57 marketing year is now estimated at 1,068,000 short tons by the Foreign Agricultural Service, only 6,000 tons less than the preliminary estimate made last December. This is about 325,000 tons more than the estimated 1955-56 production and about equal to output in 1954-55 and to the 1950-51 - 1953-54 average. These estimates reflect all production from crushing, including non-commercial output, but do not include sulphur or foots oil extracted from olive residue by solvent methods.

The quality of oil from this season's olives is unusually good in all producing countries, due mainly to the virtual disappearance of the dacus fly in 1956.

Net export availabilities of edible olive oil from the Mediterranean in 1957 may exceed 125,000 tons, compared with estimated net exports of 85,000 tons in 1956. Net exports--which represent total exports from Mediterranean countries less imports of olive oil into France and Italy --were as follows in previous years (in thousand short tons):

	1935-39 av	erage	113	
1952		64	1954	75
1953		79	1955	66

This large exportable supply--all of which probably will not be marketed this year--reflects mainly the bumper crop in Tunisia, Spain's stated intention to maximize exports, and the expected entrance of Turkey into the export market. Quantities intended for export from these 3 countries this year exceed their 1956 exports by about 45,000 tons.

Despite the large overall olive crop, import requirements of certain Mediterranean countries again are high this year. Italy, which harvested a short olive crop for the second consecutive year, is likely to import even more edible oils for domestic consumption than last year. Spain--where oil consumption is rising--again is importing sizable quantities of United States soybean oil. Turkey is planning to import tallow from the United States to free for export an equivalent amount of olive oil hitherto used for soap. Turkey will also import edible vegetable oils. The bulk of these requirements in Mediterranean countries will be met by United States exports under Title I, Public Iaw 480 and--to a lesser degree--under International Cooperation Administration (ICA) programs.

In some olive-producing countries the trends towards greater consumption of imported seed oils, either as such or blended with olive oil, has been accentuated by the shortage and consequent skyrocketing price of olive oil in the last two years.

Government and trade circles in several countries are now giving some thought to a permanent policy of maximizing exports of olive oil, making up the domestic deficit with lower-priced imported seed oils and oilseeds. If consumer acceptance of imported seed oils continue to grow, such a policy-over the years--may lessen the traditional need in olive-producing countries for carrying over sizable stocks of olive oil from "high" to "low" years.

OLIVE OIL 1/: Mediterranean Basin, estimated production, averages 1935-39, 1945-49, and 1950-53, annual 1954-56

1/ Total oil pressed in marketing season beginning October of years shown; excludes oil extracted from residue. 2/ Preliminary. 3/ Average of less than 5 years. 4/ Territory formerly known as Palestine. 5/ Figures refer only to territory formerly known as French Morocco.

Foreign Agricultural Service. Prepared or estimated on the basis of official statistics of foreign governments, reports of Agricultural Attaches and other U.S. representatives abroad, results of office research, and other information.

Commercial olive oil production in France is estimated at a modern-day low of about 1,000 short tons. Another 2,000 tons, non-commercial, is assumed to be retained by growers for family consumption. France will need to import even more olive oil than usual in 1957 and subsequent years to meet normal domestic needs. The freeze in 1956 severely damaged nearly half of France's 12 million olive trees, including 700,000 killed. Olive oil output in France is not likely to return to its pre-1956 level in less than 10 to 20 years.

Greece's production of oil from the 1956-57 crop of olives is now officially estimated at about 150,000 short tons, somewhat below earlier expectations as a result of a late-season drought. Private sources indicate a still smaller production.

In <u>Italy</u> preliminary estimates of the 1956-57 crop vary considerably, ranging from 110,000 to 155,000 tons. However, in the absence of an official estimate, it is believed that the severe regional freeze damage may have caused excessive pessimism to prevail in the trade. Thus, the crop is currently estimated at 150,000 tons to which may be added another 20,000 tons of sulphur oil which, in Italy, is mostly refined for edible use.

There is still no official report on the damage suffered by Italian olive groves from the early 1956 freeze. However, there is general agreement that the principal olive-producing areas did not suffer heavy permanent damage.

Portugal's production of olive oil in 1956-57 is officially estimated at 100,000 tons, a record for a so-called "off year." As a result of the large crop, the government has lifted the requirement--instituted in March 1956 that olive oil be blended with equal parts of peanut oil. However, exporters of olive oil are still required to replace exports with equal quantities of imported peanut oil.

The estimate for <u>Spain's 1956-57</u> olive oil production is unchanged at about 400,000 tons, the largest crop since 1951. This is the estimate of the semi-official Olive Oil Syndicate. The export target in 1957 is 55,000 tons, substantially above the unofficially estimated 44,000 tons exported in 1956, of which nearly half went to the United States.

Yugoslavia's olive trees apparently were not damaged as badly as had been believed earlier. The official estimate of the 1956-57 olive harvest of 23,500 tons is only moderately below the average of 30,000 tons for the last 5 years.

Israel harvested a good crop of olives, estimated at 26,500 tons, of which about 22,500 tons were crushed to produce 4,400 tons of oil. Two modern crushing plants operating this season reportedly turned out an unusually high quality oil. With rationing of olive oil discontinued, Israel is aggressively competing for export business in various foreign markets, including the United States.

The olive crop in <u>Lebanon</u> was exceptionally large because of adequate rainfall late in the growing season. Oil production for 1956-57 is now estimated at 15,000 tons, about 4 times last season's. In view of the good crop, the government has already freed 4,000 tons of oil for export. Net exports of edible oil in 1956 were negligible.

Syria's estimated edible olive oil production from the 1956 crop is 8,000 tons, nearly twice the previous year's output and about two-fifths over the 1950-53 average. This reflects the good recovery made by Syria's olive groves since the 1950 freeze which killed or damaged many trees.

Despite excessively dry weather during the ripening period, Turkey apparently harvested a record crop of olives. Production of oil in 1956-57 is currently estimated at 75,000 tons. Since the end of the harvest was delayed well into April this year, the current estimate is still preliminary, but production will probably exceed the previous record of 70,000 tons produced in 1954-55.

The Turkish Government on March 14 prohibited the use of olive oil for scapmaking, to make available a planned 15,000 metric tons for export. Imports of United States tallow under Title I, Public Law 480 will help make this export possible.

Production of olive oil in 1956-57 in Algeria, Tunisia, and Morocco, combined, is estimated at 155,000 tons, nearly 3 times last year's. This large output, with its consequent large export availabilities, will benefit France which usually obtains most of its imports from North Africa and needs larger than usual imports this year.

The semi-official Office de l'Huile has preliminarily estimated Tunisian production at about 90,000 tons. Other sources believe the crush may turn out as high as 100,000 tons. In any case, Tunisia's edible oil production will be second in size to the record 115,000 tons produced in 1949-50. In addition, there will be more than 10,000 tons of sulphur oil. Exportable supplies from the 1956-57 crush are estimated to be 40-50,000 tons, after allowing for "security stocks" of over 13,000 tons. More than 13,000 tons had been exported by March 25, virtually all to France, the United States, and Italy.

CORRECTION

In WORLD AGRICULTURAL STATISTICS -- Area Harvested, on Page 4 of Warch 1957 monthly issue of Foreign Crops and Markets, the "total area harvested" for COTTON should have been 79.4 million acres (not 76.9 million). This makes the total area harvested for all commodities listed 1602.9 million (not 1600.4 million).

The Commodity Summaries in this monthly supplementary issue of Foreign Crops and Markets are part of a series of reports on World Crop and Livestock Production and Trade which are released according to a schedule published at the beginning of each calendar year.

The country data are prepared or estimated on the basis of official statistics of foreign governments, reports of Agricultural Attaches and other U. S. Representatives abroad, results
of office research, and other information. The Summaries of
Production have been approved by the Foreign Agricultural
Service Committee on Foreign Crops and Livestock Statistics.

FOREIGN CROPS AND MARKETS

Published weekly and monthly to assist the foreign marketing of U. S. farm products by keeping the nation's agricultural interests informed of current crop and livestock developments abroad, foreign trends in production, prices, supplies and consumption of farm products, and other factors affecting world agricultural trade. Circulation is free to persons in the U. S.

Foreign Crops and Markets is distributed only upon a request basis. Should you find you have no need for this publication, please tear off the addressograph imprint with your name and address, pencil "drop" upon it, and send it to the Foreign Agricultural Service, Room 5918, U.S. Department of Agriculture, Washington 25, D.C.
